

In the claims:

For the Examiner's convenience, all pending claims are presented below with changes shown.

1. (Currently Amended) A method comprising:

encrypting, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input~~write data to generate one or more respective portions of ~~output~~ encrypted write data to be stored in one or more locations in storage; ~~and at least one of:~~

generating, based ~~at least in part~~ upon the one or more respective portions of the ~~output~~encrypted write data, check data to be stored in the storage; and

selecting the one or more locations so as to permit the one or more respective portions of the ~~output~~encrypted write data to be distributed among two or more storage devices comprised in the storage.

2. (Currently Amended) The method of claim 1, wherein:

the storage comprises a redundant array of independent disks (RAID); and

the check data comprises one of parity data and a copy of the ~~output~~encrypted write data.

3. (Currently Amended) The method of claim 1, further comprising:

storing the at least one key in memory; and

in response, ~~at least in part,~~ to an attempt to tamper with the at least one key, erasing the at least one key from the memory.

4. (Currently Amended) The method of claim 1, further comprising:
determining, based at least in part upon one or more credentials, whether to permit execution of one or more operations involving the storage.
5. (Currently Amended) A method comprising:
receiving a read request;
retrieving one or more respective portions of the encrypted data from a plurality of storage devices comprised in the storage; and
decrypting, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input the encrypted read data retrieved from one or more respective locations in storage to~~ generate one or more respective portions of output read data; and ~~at least one of:~~
~~generating check data to be stored in the storage, the check data being generated based at least in part upon the one or more respective portions of the input data; and~~
~~retrieving the one or more respective portions of the input data from a plurality of storage devices comprised in the storage.~~
6. (Currently Amended) The method of claim 5, further comprising:
~~receiving a request to retrieve requested data from the storage, the requested data comprising the output data; and prior to the decrypting of the one or more respective portions of the input encrypted data, determining, based at least in part upon one or more credentials, whether the request is authorized.~~

7. (Currently Amended) The method of claim 6, further comprising:
generating, ~~at least in part~~, the at least one key based ~~at least in part~~ upon at least one of one or more tokens and one or more passwords.
8. (Currently Amended) The method of claim 5, wherein:
the storage also stores metadata; and
the method further comprises encrypting the metadata based ~~at least in part~~ upon the at least one key.
9. (Original) The method of claim 8, wherein:
the metadata comprises partition information.
10. (Currently Amended) An apparatus comprising:
circuitry to encrypt, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input~~write data to generate one or more respective portions of ~~output~~encrypted write data to be stored in one or more locations in storage;
the circuitry also being capable of ~~at least one of~~:
generating, based ~~at least in part~~ upon the one or more respective portions of the ~~output~~encrypted write data, check data to be stored in the storage; and
selecting the one or more locations so as to permit the one or more respective portions of the ~~output~~encrypted write data to be distributed among two or more storage devices comprised in the storage.

11. (Currently Amended) The apparatus of claim 10, wherein:
the storage comprises a redundant array of independent disks (RAID); and
the check data comprises one of parity data and a copy of the ~~output~~encrypted write
data.
12. (Currently Amended) The apparatus of claim 10, wherein:
the circuitry is also capable of storing the at least one key in memory; and
in response, ~~at least in part,~~ to an attempt to tamper with the at least one key, erasing
the at least one key from the memory.
13. (Currently Amended) The apparatus of claim 10, wherein:
the circuitry is also capable of determining, based ~~at least in part~~ upon one or more
credentials, whether to permit execution of one or more operations involving the storage.
14. (Currently Amended) An apparatus comprising:
circuitry to receive a read request, retrieve one or more respective portions of the
encrypted data from a plurality of storage devices comprised in the storage and decrypting,
based upon at least one key, one or more respective portions of the encrypted read data
retrieved from storage to generate one or more respective portions of output read data
~~decrypt, based least in part upon at least one key, one or more respective portions of~~
~~input~~write data from storage to generate one or more respective portions of outputencrypted
write data; ~~the circuitry being capable of at least one of: generating check data to be stored in~~

~~the storage, the check data being generated based at least in part upon the one or more respective portions of the inputwrite data; and retrieving the one or more respective portions of the inputwrite data from a plurality of storage devices comprised in the storage.~~

15. (Currently Amended) The apparatus of claim 14, wherein the circuitry is also capable of:

~~receiving a request to retrieve requested data from the storage, the requested data comprising the output data; and prior to the decrypting of the one or more respective portions of the input encrypted data, determining, based at least in part upon one or more credentials, whether the request is authorized.~~

16. (Currently Amended) The apparatus of claim 15, wherein:

~~the circuitry is also capable of generating, at least in part, the at least one key based at least in part upon at least one of one or more tokens and one or more passwords.~~

17. (Currently Amended) The apparatus of claim 14, wherein:

~~the storage also stores metadata; and the circuitry is also capable of encrypting the metadata based at least in part upon the at least one key.~~

18. (Original) The apparatus of claim 17, wherein:

~~the metadata comprises partition information.~~

19. (Currently Amended) An article comprising a storage medium having stored therein instructions that when executed by a machine result in the following:

encrypting, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input~~write data to generate one or more respective portions of ~~output~~ encrypted write data to be stored in one or more locations in storage; ~~and at least one of:~~

generating, based ~~at least in part~~ upon the one or more respective portions of the ~~output~~encrypted write data, check data to be stored in the storage; and

selecting the one or more locations so as to permit the one or more respective portions of the ~~output~~encrypted write data to be distributed among two or more storage devices comprised in the storage.

20. (Currently Amended) The article of claim 19, wherein:

the storage comprises a redundant array of independent disks (RAID); and

the check data comprises one of parity data and a copy of the ~~output~~encrypted write data.

21. (Currently Amended) The article of claim 19, wherein the instructions when executed by the machine also result in:

storing the at least one key in memory; and

in response, ~~at least in part,~~ to an attempt to tamper with the at least one key, erasing the at least one key from the memory.

22. (Currently Amended) The article of claim 19, wherein the instructions when executed by the machine also result in:

determining, based ~~at least in part~~ upon one or more credentials, whether to permit execution of one or more operations involving the storage.

23. (Currently Amended) An article comprising a storage medium having stored therein instructions that when executed by a machine result in the following:

receiving a read request;

retrieving one or more respective portions of the encrypted data from a plurality of storage devices comprised in the storage; and

decrypting, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input~~ the encrypted read data retrieved from ~~one or more respective locations in~~ storage to generate one or more respective portions of ~~output read data; and at least one of:~~

~~generating check data to be stored in the storage, the check data being generated based at least in part upon the one or more respective portions of the input data; and~~

~~retrieving the one or more respective portions of the input data from a plurality of storage devices comprised in the storage.~~

24. (Currently Amended) The article of claim 23, wherein the instructions when executed by the machine also result in:

~~receiving a request to retrieve requested data from the storage, the requested data comprising the output data; and prior to the decrypting of the one or more respective portions of the input~~ encrypted data, determining, based ~~at least in part~~ upon one or more credentials,

whether the request is authorized.

25. (Currently Amended) The article of claim 24, wherein the instructions when executed by the machine also result in:

generating, ~~at least in part~~, the at least one key based ~~at least in part~~ upon at least one of one or more tokens and one or more passwords.

26. (Currently Amended) The article of claim 23, wherein:

the storage also stores metadata; and

the instructions when executed by the machine also result in encrypting the metadata based ~~at least in part~~ upon the at least one key.

27. (Original) The article of claim 26, wherein:

the metadata comprises partition information.

28. (Currently Amended) A system comprising:

a circuit board comprising a circuit card slot and a circuit card that is capable of being inserted into the circuit card slot, the circuit card comprising circuitry, the circuitry being capable of encrypting, based ~~least in part~~ upon at least one key, one or more respective portions of ~~input~~write data to generate one or more respective portions of ~~output~~encrypted write data to be stored in one or more locations in storage;

the circuitry also being capable of ~~at least one of~~:

generating, based ~~at least in part~~ upon the one or more respective portions of the ~~output~~encrypted write data, check data to be stored in the storage; and

selecting the one or more locations so as to permit the one or more respective portions of the ~~output~~encrypted write data to be distributed among two or more storage devices comprised in the storage.

29. (Currently Amended) The system of claim 28, wherein: the circuitry comprises an input/output (I/O) processor, and non-volatile memory that is capable of storing the at least one key; and the circuitry is capable of detecting an attempt to tamper with the at least one key, and in response, ~~at least in part~~, to the attempt, erasing the at least one key from the memory.

30. (Original) The system of claim 29, wherein:
the circuit board also comprises a host processor coupled to the circuit card slot via a bus, and one or more token memories to store one or more tokens; and
additional circuitry to read one or more additional tokens stored in a removable token memory after the removable token memory is inserted into a token reader.

31. (Currently Amended) A system comprising:
a circuit board comprising a circuit card slot and a circuit card capable of being inserted into the circuit card slot, the circuit card comprising circuitry to receive a read request, retrieve one or more respective portions of the encrypted data from a plurality of storage devices comprised in the storage and decrypting, based upon at least one key, one or

~~more respective portions of the encrypted read data retrieved from storage to generate one or more respective portions of read data decrypt, based at least in part upon at least one key, one or more respective portions of input data from storage to generate one or more respective portions of output data;~~

~~the circuitry also being capable of at least one of:~~

~~generating check data to be stored in the storage, the check data being generated based at least in part upon the one or more respective portions of the input data; and~~

~~retrieving the one or more respective portions of the input data from a plurality of storage devices comprised in the storage.~~

32. (Original) The system of claim 31, further comprising:

an input/output (I/O) controller coupled to a redundant array of independent disks (RAID); and

a bus via which the controller is coupled to the circuitry.

33. (Original) The system of claim 32, wherein:

the circuit board also comprises a host processor coupled to the slot and the controller.
